Henry: Superio Journal (blog) Implementation Guide

Written 8 Nov 2026. This guide covers what the blog is, how each page is laid out, how you receive each week's work, and exactly what you do with it. Website and shop only. Anything you are unsure about goes to Callum with a screenshot.

1. What the blog is

A section called the **Journal** at **superiofurniture.com/blog/**, on the same domain as the main site (not WordPress, not a separate site). The site is static and deployed by upload, so the blog is a folder of plain HTML files. One new post goes live every week. Each post helps people choose furniture, answers real questions, and links to one service page and the free quote.

2. How each page is laid out

Journal home page (/blog/)

- Same menu, footer and cookie banner as the Terms page (it is built from that page).
- Heading "The Superio Journal" and one short intro line.
- A list of posts, newest first. Each entry: small date and reading time, the post title as the link, and a one-sentence summary.
- The weekly pack already contains the updated home page. You never edit the list by hand.

A post (/blog/post-name/)

1. Title (one H1) and a small line with the date and reading time.
2. A larger lead paragraph that answers the question in two or three sentences.
3. Main body in sections with H2 headings. Images sit full width inside the text, each with a caption. Comparison tables are used where they help.
4. A short FAQ block (these also feed Google's question-and-answer markup).
5. A call-to-action box near the end: a sentence and a "Get a free quote" button to /contact/.
6. A "Related" area with links to the matching service page and shop page.

The page head already holds the title, description, canonical address, social preview and structured data. Nothing to add. There are no prices, and AI illustrations are captioned "concept image".

3. How you receive the work

1. Callum sends you everything on WhatsApp. Each week you get one message with the instruction, plus the zip file attached to it. You do not need to open the Drive.
2. Save the zip from WhatsApp to your computer (on WhatsApp Web use the download arrow), then unzip it and follow section 4.
3. The message arrives early in the week so the post can go live on Wednesday. If something is missing from a message, reply on WhatsApp and Callum will resend it.
4. When the post is live, reply "live" with the link.

4. One-off setup (with week 1 only)

1. Upload `blog/index.html` from the week 1 zip.
2. Add a **Journal** link to `/blog/` in the main menu on every page (after Showcase) and in the footer.
3. Add the blog home and each post to `sitemap.xml`. Robots.txt already allows everything.

5. Every week

1. Download the zip and unzip it. Copy its `blog` folder into the site source, merging with the existing `blog` folder. Only `blog/index.html` is overwritten.
2. Open the new post's index.html in a browser and read it once: images show, menu and footer match the Terms page.
3. Add the new post's address to `sitemap.xml` (the line is in WEEK-NOTES.txt).
4. Make the one link edit in WEEK-NOTES.txt: paste the given sentence into the named service page so it links to the new post.
5. Upload the site as usual.
6. Check the live post loads with images, and the Journal page shows it at the top.
7. In Google Search Console: resubmit the sitemap, then URL Inspection on the new post and Request indexing.
8. Message Callum "live" with the link.

If anything looks wrong, do not change the wording. Send Callum a screenshot and say what you saw.

6. What is in each week's folder

- `blog/post-name/index.html`: the finished post. Do not edit the wording.
- `blog/post-name/images/`: images already converted to WebP at 1200 pixels wide.
- `blog/index.html`: the Journal home page with the new post at the top.
- `WEEK-NOTES.txt`: the post address, the sitemap line, and the one sentence to paste.
- `_template-blog-post.html`: week 1 only, the blank template.

7. Questions you may have

Why not WordPress? The site is static. A separate WordPress blog would sit on its own address and pass little ranking benefit to the main pages.

Does it need a build or database? No. Each post is one HTML file with its images.

Can I change wording or images? No. Each post has been checked for claims and tone. Send Callum a screenshot if something looks wrong.

Why no prices? Prices are quoted per job, so posts point to the shop and the free quote.

Why do some captions say "concept image"? They are AI illustrations, not finished jobs. Real photos will replace them next year.

Can two posts share an address? No, each post has its own folder. Never rename a live post's folder, because it breaks links and search results.

Do the cookie banner and analytics work? Yes, the template is the same as the rest of the site.

What if I am away that week? Skip it and tell Callum. Packs are independent and can go live later.

Something not covered? Message Callum with the question and a screenshot. He passes it to the AI OS, which updates this guide.
